Supplement 10

Experiment 1 – Rating variance in the SPARS

Peter Kamerman

21 Jun 2018

Contents

This script is part 6 of our analysis of the stimulus-response characteristics of the SPARS. In these analyses we assessed intra-individual and inter-individual variability in scoring on the SPARS at each pain intensity.

We used the *median absolute deviation* (MAD), which is a robust measure of dispersion, to assess variance. To calculate intra-individual variance for each stimulus intensity, we calculated the MAD using the ratings from repeated stimuli at each stimulus intensity. We also used the MAD for calculating inter-individual variance for each scale and at each intensity, using the median ratings by individuals at each intensity as the input.

Median absolute deviation

$$MAD = median(|X_i - median(X)|)$$

Descriptive plots of the data are provided in *"outputs/supplement_5.pdf"*, modelling of the stimulus-response relationship is described in *"outputs/supplement_6.pdf"*, the diagnostics on the final linear mixed model are described in *"outputs/supplement_7.pdf"*, the stability of the model is described in *"outputs/supplement_8.pdf"*, and the sensitivity of the scale to changes in stimulus intensity are described in *"outputs/supplement_9.pdf"*.

Import and clean/transform data

```
############################################################
#                                                          #
#                        Import                            #
#                                                          #
############################################################
data <- read_rds('./data-cleaned/SPARS_A.rds')

############################################################
#                                                          #
```

```
#                           Clean                            #
#                                                            #
##############################################################
data %<>%
  # Select required columns
  select(PID, intensity, rating)
```

Intra-individual variation (participant-level)

```
# Calculate MAD
data_varianceP <- data %>%
    group_by(PID, intensity) %>%
    summarise(MAD = mad(x = rating,
                        constant = 1,
                        na.rm = TRUE)) %>%
    ungroup()

# Plot
ggplot(data = data_varianceP) +
    aes(y = MAD,
        x = sprintf('%.02f', intensity)) +
    geom_point(shape = 21,
               size = 4,
               fill = '#E69F00') +
    geom_hline(yintercept = 10,
               linetype = 2) +
    labs(title = 'Participant-level median absolute deviation (MAD) for the SPARS',
         subtitle = 'Dotted line: 10% of scale range (100 units)',
         y = 'Median absolute deviation',
         x = 'Stimulus intensity (J)') +
    scale_y_continuous(limits = c(0, 25)) +
    facet_wrap(~ PID, ncol = 3) +
    theme(axis.text.x = element_text(angle = -90))
```
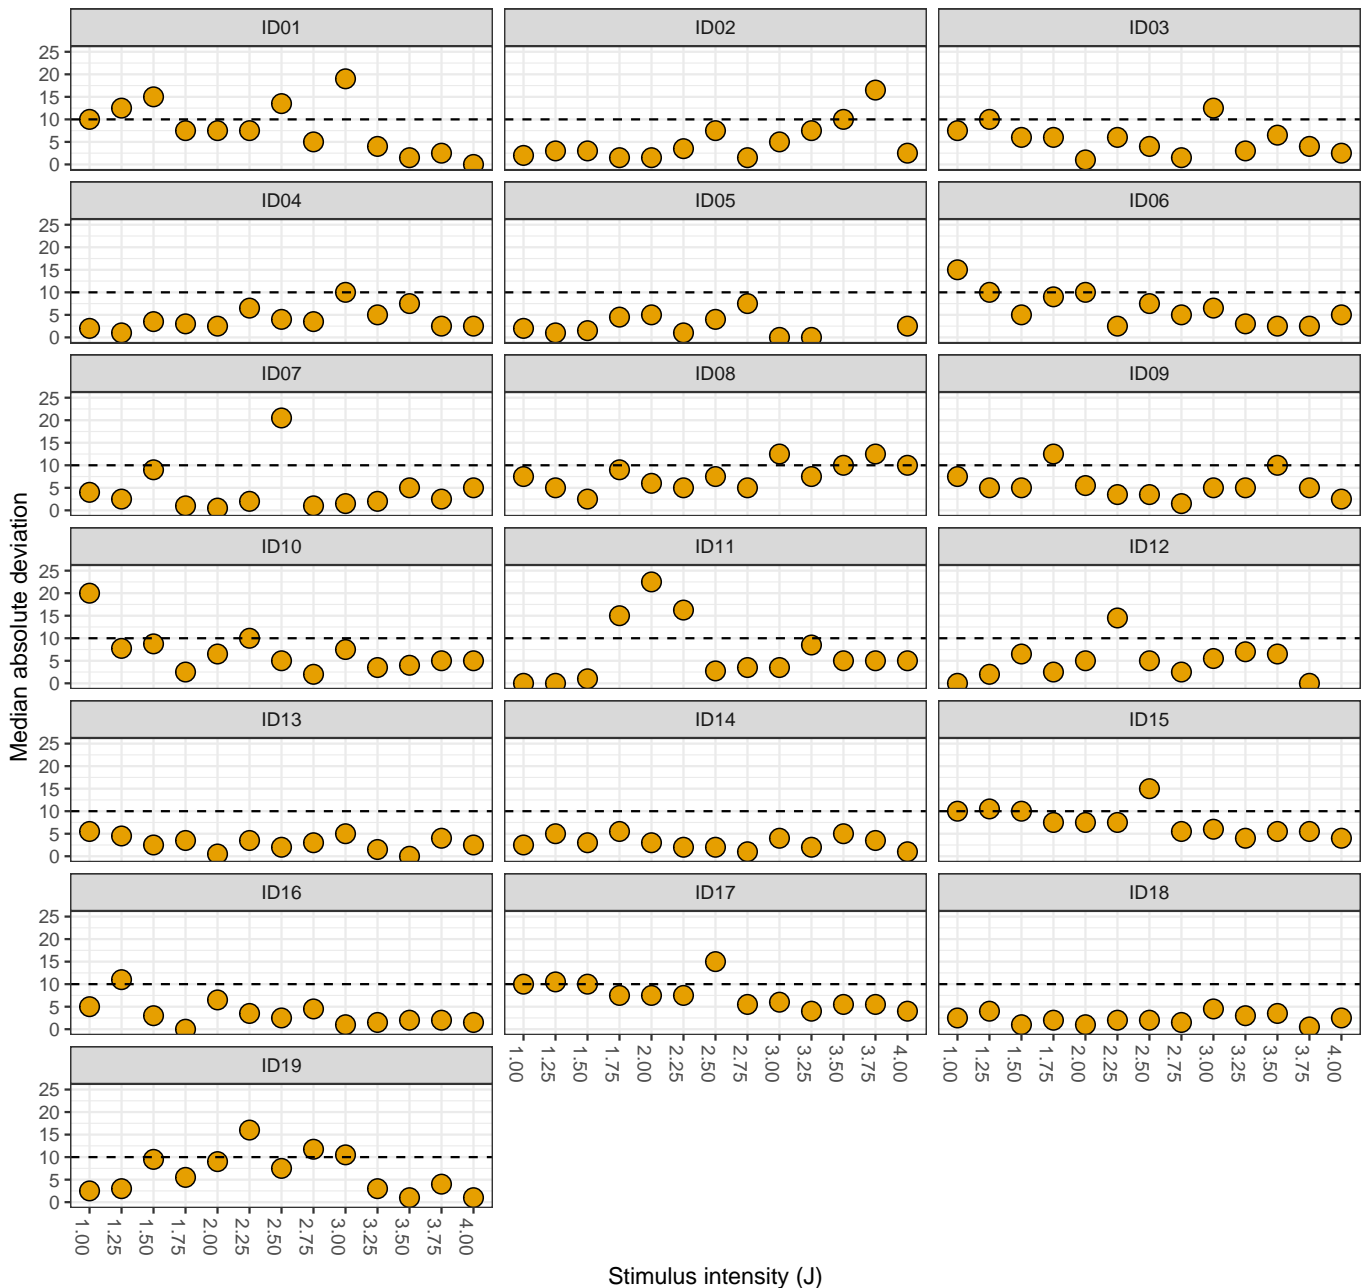

Participant–level median absolute deviation (MAD) for the SPARS
Dotted line: 10% of scale range (100 units)

There is no clear pattern in intra-individual variance in intensity rating within the scale. Variance can be high on a case-by-case basis, but most MAD value are < 10% of the scale range (100 units, -50 to 50).

Inter-individual variation (group-level)

```r
# Process data for plotting
data_varianceG <- data %>%
    # Calculate median rating at each stimulus intensity for each scale per PID
    group_by(PID, intensity) %>%
    summarise(median = median(rating,
                              na.rm = TRUE)) %>%
    # Calculate group MAD
    group_by(intensity) %>%
```

```r
    summarise(MAD = mad(median,
                        constant = 1,
                        na.rm = TRUE)) %>%
    ungroup()

# Plot
ggplot(data = data_varianceG) +
    aes(y = MAD,
        x = sprintf('%.02f', intensity)) +
    geom_point(shape = 21,
               size = 4,
               fill = '#E69F00') +
    geom_hline(yintercept = 10,
               linetype = 2) +
    labs(title = 'Group-level median absolute deviation (MAD) for the SPARS',
         subtitle = 'Dotted line: 10% of scale range (100 units)',
         y = 'Median absolute deviation',
         x = 'Stimulus intensity (J)') +
    scale_y_continuous(limits = c(0, 25)) +
    theme(axis.text.x = element_text(angle = -90))
```
Group–level median absolute deviation (MAD) for the SPARS

Dotted line: 10% of scale range (100 units)

Other than an 'odd' value at 1J, there is a trend for high inter-individual MAD values at low stimulus intensities, and for this variance to decrease as stimulus intensity increases.
